Housed in the previous District Office, 777 Long Road, the state-of-the-art technology center contains the District’s core network and telephone equipment, as well as servers that host enterprise applications such as email, voicemail, HVAC and anti-virus software.

The data center can be expanded to handle additional equipment and offers a physically secure, air-conditioned environment with battery backup and a natural gas generator that will keep the equipment running in the case of a power failure.

As the District prepares to accommodate increased technology use by students and staff, updating and consolidating the data center permits the Pickerington Local School District to take advantage of new technologies and instructional models that prepare students for college and the 21st century workplace.

The consolidation of networking systems into one centralized location prompted the move of office personnel to the District Office. This renovation was funded by the Classroom Facilities Maintenance Project.
